

Madhav Solar

Funnel Landing Page Strategy

Core Objective

This landing page should not behave like a corporate website page.

It should behave like a decision-making funnel for high-intent C&I and industrial solar prospects.

The page must move the prospect through one clear journey:

Business Problem → Commercial Relevance → Engineering Credibility → Proof → Qualification → Sales Conversation

The objective is not maximum traffic.

The objective is:

More commercially relevant conversations with businesses actively evaluating solar.

1. HERO SECTION

Headline

Your Energy Cost Shouldn't Control Your Growth.

Subheadline

Madhav Solar helps commercial and industrial businesses reduce long-term power-cost exposure through engineered solar solutions built around performance, reliability and business economics.

Primary CTA

Get Your Solar Opportunity Assessment

Secondary CTA

Speak With a Solar Expert

Supporting Line

For manufacturing, commercial, institutional and energy-intensive businesses.

Visual Direction

Use a strong real-project visual.

Prefer:

- Industrial rooftop
- Manufacturing facility
- Large-scale solar installation
- Engineering team / project execution

Avoid generic “green future” stock visuals.

2. THE BUSINESS PROBLEM

Solar Is Not a Panel Decision. It Is a Business Economics Decision.

For energy-intensive businesses, electricity is no longer just an operating cost.

It directly influences:

- Margins
- Production economics
- Cost predictability
- Business competitiveness
- ESG commitments
- Long-term operating strategy

The question is no longer:

“Should we install solar?”

The better question is:

“What role should solar play in our long-term energy strategy?”

3. THE STRATEGIC VALUE

Solar Engineered Around Business Economics.

Madhav Solar should not position itself as another EPC vendor selling capacity.

The stronger proposition is:

Engineering precision. Execution reliability. Commercial viability.

Lower Grid Dependence

Reduce exposure to conventional power dependence.

Better Cost Visibility

Build greater predictability into long-term energy planning.

Stronger Business Economics

Evaluate solar through ROI, payback and lifecycle value.

Sustainable Growth

Support clean-energy and decarbonisation objectives without separating sustainability from business performance.

4. WHY MADHAV SOLAR

Businesses Need More Than an EPC Contractor.

A solar asset is expected to perform for years.

That means poor engineering, weak execution or incorrect commercial planning can create long-term consequences.

Madhav Solar's role should be presented across four dimensions:

Capability	Business Relevance
Engineering	Solutions designed around actual site and operating conditions
Execution	Reliable project delivery with focus on quality
Economics	Solar evaluated as a business investment
Scale	Solutions structured for commercial and industrial requirements

Core Positioning

Madhav Solar does not only build solar projects. It helps businesses make better energy decisions.

5. WHO WE SOLVE FOR

Different Industries. Different Energy Problems.

Solar should not be marketed using one generic message.

Each sector has a different commercial trigger.

Manufacturing

High energy consumption, margin pressure and long-term power-cost exposure.

Communication angle:

Turn energy cost into a more predictable business variable.

Warehousing & Logistics

Large infrastructure footprints with significant rooftop potential.

Communication angle:

Turn underutilised infrastructure into productive energy assets.

Hospitality

High operational consumption and increasing sustainability expectations.

Communication angle:

Improve operating economics while strengthening sustainability performance.

Healthcare

High and continuous energy requirements.

Communication angle:

Build cleaner long-term energy infrastructure without compromising reliability.

Commercial Real Estate

Asset efficiency, operating costs and ESG performance.

Communication angle:

Improve the energy economics of commercial assets.

Data Centres / High-Energy Businesses

Energy intensity, reliability and sustainability pressures.

Communication angle:

Build a smarter long-term renewable energy strategy.

6. SOLUTION ARCHITECTURE

The Right Solar Model Depends on Your Business.

There is no single solution that fits every organisation.

The correct model depends on:

- Power consumption
- Location
- Infrastructure
- Available roof / land
- Investment preference
- Regulatory environment
- Long-term energy strategy

Rooftop Solar

For businesses with usable rooftop infrastructure and significant daytime consumption.

Ground-Mounted Solar

For larger projects where land and scale create stronger generation potential.

Captive / Group Captive

For businesses exploring structured long-term renewable power procurement.

Open Access

For enterprises evaluating renewable energy beyond on-site generation.

CTA

Find the Right Solar Model for Your Business

7. THE CFO SECTION

Before Solar Becomes an ESG Decision, It Has to Make Financial Sense.

Senior decision-makers need answers to commercial questions.

Not just installed capacity.

They need clarity on:

- What is the investment?
- What is the expected commercial benefit?
- What is the payback?
- CAPEX or OPEX?
- What are the execution risks?
- What happens to long-term energy costs?
- How does EPC quality impact lifecycle economics?

Core Line

Solar should be evaluated as a long-term business asset—not as a sustainability expense.

CTA

Request an ROI Discussion

8. PROJECT PROOF

Proof Should Be Measured in Outcomes, Not Just Megawatts.

Most solar companies communicate:

“Project commissioned — X MW.”

That shows activity.

It does not necessarily show capability.

Madhav Solar’s project stories should instead follow:

The Business Challenge

What problem was the client trying to solve?

The Site / Engineering Challenge

What made the project technically or operationally complex?

Madhav Solar's Approach

How was the solution designed and executed?

The Outcome

What business, energy or operational impact did the project create?

Recommended Project Card Format

Industry

Manufacturing

Location

Client location

Capacity

Actual MW / kW

Challenge

High energy dependence / complex roof / operational limitations.

Solution

Custom engineering and project execution.

Impact

Verified project or energy outcome.

Only use actual client-provided figures.

Do not manufacture ROI or savings data.

9. THE DECISION FRAMEWORK

Solar Decisions Should Be Made on Fit, Not Fashion.

This section should visually answer the common buying questions.

Rooftop vs Ground-Mount

Which model suits the infrastructure?

CAPEX vs OPEX

Which model suits the company's investment strategy?

Captive vs Open Access

Which structure fits energy requirements and geography?

On-Site vs Off-Site

Which approach delivers stronger long-term commercial value?

CTA

Discuss the Right Model With Our Team

10. THE PROCESS

From Energy Requirement to Executable Solar Roadmap

01. Understand

Study consumption, infrastructure and commercial objectives.

02. Assess

Evaluate technical and commercial feasibility.

03. Design

Develop the appropriate solar architecture.

04. Evaluate

Assess investment structure, performance and long-term economics.

05. Execute

Engineering, procurement and implementation.

06. Optimise

Focus on reliable long-term asset performance.

11. THE CONVERSION OFFER

Before You Invest in Solar, Understand What the Opportunity Is Worth.

Instead of asking prospects to “Contact Us,” give them a reason to engage.

Offer

Get Your Solar Opportunity Assessment

The assessment should help evaluate:

- Suitable solar model
- Approximate project opportunity
- Technical feasibility
- Commercial considerations
- CAPEX / OPEX suitability
- Recommended next step

CTA

12. LEAD QUALIFICATION FORM

Tell Us About Your Energy Requirement

Do not make the form unnecessarily long.

The objective is to identify commercial intent.

Recommended Fields

Name

Company Name

Designation

Business Email

Mobile Number

Industry

Project Location

Approximate Monthly Electricity Bill / Consumption

Requirement:

- Rooftop Solar
- Ground-Mount
- Captive / Group Captive
- Open Access
- Not Sure

Timeline:

- Immediate
- Within 3 Months
- 3–6 Months
- 6–12 Months

- Currently Exploring

CTA

Assess My Solar Opportunity

13. BUYING-COMMITTEE TRUST SECTION

One Solar Project. Multiple Business Questions.

CEO / MD

Will this improve our long-term competitiveness?

CFO

Does the investment make commercial sense?

Plant Head

Can this be executed without compromising operations?

Procurement Head

Can this partner deliver at the required quality and scale?

Sustainability Head

How does this support our renewable-energy and decarbonisation goals?

Core Message

Madhav Solar should answer the business case, not just the technical case.

14. AUTHORITY / KNOWLEDGE SECTION

Decisions Become Easier When the Market Is Better Informed.

Use this section to showcase:

- Solar Economics Insights
- CAPEX vs OPEX Guides
- Open Access Insights
- Industry Reports
- Policy Updates
- Project Case Studies
- Engineering Explainers
- Leadership POVs

This content is not only for SEO.

It should help Madhav Solar become a trusted source during the buyer's research phase.

15. FAQ SECTION

Is solar financially viable for industrial businesses?

The answer depends on consumption profile, location, commercial model, project scale and investment structure. A detailed feasibility assessment is required before determining project economics.

CAPEX or OPEX—which is better?

Neither is universally better. The appropriate model depends on capital allocation priorities, risk appetite and long-term business objectives.

Which industries are best suited for commercial solar?

Energy-intensive businesses with predictable consumption can potentially benefit significantly, subject to technical and regulatory feasibility.

Can Madhav Solar support both rooftop and larger projects?

Madhav Solar's communication and solution portfolio should cover rooftop, ground-mount, captive/group captive and open-access opportunities.

How do we know how much solar capacity we need?

The requirement should be determined after analysing actual power consumption, operating pattern, infrastructure and commercial objectives.

16. FINAL CONVERSION SECTION

Before You Buy Solar, Know What It Can Do for Your Business.

Supporting Copy

Understand the technical feasibility, commercial model and long-term energy opportunity before making an investment decision.

VISUAL SYSTEM

The page should feel:

Premium
Industrial
Technical
Commercial
Confident

Avoid:

- Excessive green
- Generic leaf visuals
- Sustainability clichés
- Stock handshake imagery
- Too many panel photographs
- Long technical paragraphs
- Generic “Go Green” messaging

Use:

- Real project photography
- Engineering detail
- Manufacturing environments
- Large typography
- Strong numerical proof
- Minimal iconography
- Technical grid systems
- White space
- Project diagrams
- Commercial data visualisation

Recommended Visual Balance

60% Industrial / Engineering

25% Business / Commercial

15% Sustainability
